Tucked away within Access are some hidden features that can help you to back up and secure your database in one-click. It is often easy to forget that that your databases are not safe. These little things can often be overlooked and many an Access Database can be lost if you've not taken the proper precautions. First of all, the database menus are dangerous. If you do not know what you are doing and accidentally open a menu and click on a sub-menu item that you had no intention of selecting, you may inadvertently recreate a database that you did not intend to recreate! It's always wise to play safe with menus, and it is also easy to do so. You simply press Ctrl+F10 to bring up the options menu, and then you can select 'menu exit' to close the menu. Alternatively, you can select 'All menus' from the File menu to close all the menus. Second, the toolbar is also quite dangerous. One of the most dangerous items on your Access toolbar is the Copy button. If you accidentally click on it and choose not to 'Copy to Clipboard', the database will be permanently

Strictly source-corrected optical coherence tomography with complex demodulation for a multiple-input multiple-output system. We theoretically investigate the quality of a source-corrected optical coherence tomography system with complex demodulation for multiple-input multiple-output (MIMO) systems. Previously, it was shown in the frequency domain that the complex demodulation improves the quality of source-corrected optical coherence tomography (OCT). We show here that this result does not extend to MIMO systems. We show that for MIMO systems, the amount of speckle present at the imaging plane is higher than for equivalent coherent systems. We derive a lower limit on the number of sources for which complex demodulation improves the quality of OCT. This lower limit corresponds to a minimum MIMO size equal to four
