This mode is based on high-intensity football matches, where players deal with the pressure and intensity of big, high-octane matches. Here is how it works: During the matches, players use the motion capture that they've recorded during training sessions. Players have to react and perform with their real-life movements, tackles and aerial duels. In these matches you have three goals. Each of them gives the player a certain amount of points and bonus items. The first match determines what kind of goal-scoring technique you'll see in the rest of the season. This is the only match where you have to do special tabbos on the ball while attackers deke around defenders to score. The second match will help you develop your own style of play. This is where we will get to see players use fake shots when trying to deceive their opponents. We're going to see players fire shots that aren't even close to their goal. The third match will be the regular goalscoring match. Here, you'll need to

FIFA is the world's biggest football game franchise, with more than 50 million copies sold in more than 50 languages. Considered by fans and critics alike to be the standard for football games, the series is already a milestone for EA SPORTS. FIFA 20 features legendary clubs and stadiums, all-new gameplay mechanics, updated features, and more. Two main improvements in FIFA 20: The FIFA 20 Demo lets fans try the newest game features ahead of the release on September 27, 2019. Play your way FIFA 20 lets players play their way: choose from a variety of authentic kits for your favorite teams, as well as the look and feel that suits their playing style. FIFA Ultimate Team lets fans unlock and collect legendary players, and prove their worth through challenge matches. In Ultimate Team, every decision counts. Whether you're buying packs to build a winning squad or upgrading boots or pitches, there's no room for mistakes. New Passes and Attacks With Passes and Attacks, players now control their runs with unprecedented precision and accuracy. Shift your weight to control your run with increased and appropriate balance, and the new control system emulates moves from top-level European soccer. Pass and attack smarter and faster, make sharper movements and execute more precise and deadly finishes. Players can now retain control of forward runs even when they're pushed off-balance. Or, when running, make smarter changes of pace to keep possession. It's all up to you. New Tactics and Skills Real-world tactics and training improve the way you control your team on the pitch. FIFA's player-made tactics will let you decide how you want to play. For example, Over-Defender gives players total control over defense and offense, and lets them decide where their passes should go. Or, you can set up a passing system, with different roles for your players. Run the Alves-Welbeck-Handski passing triangle for shorter, less accurate passes, or your Raphael-El-Tottenham triangle for more accurate long balls. New Movement Get ready for a faster, more fluid, and more tactical game. FIFA 20 will offer more space on the pitch, along with larger boundaries, a host of new dynamic

The subject matter of the present application relates to microelectronic devices and related structure, and more particularly, to interconnect structures with controlled tip geometry for connecting one or more microelectronic devices. Most integrated microelectronic devices such as, for example, semiconductor devices are in the form of a multi-chip module (MCM) including two or more microelectronic devices (e.g., dies) mounted to a base substrate and connected to each other by an interconnect structure. In order to make such multi-chip modules (MCMs) more compact, more and more dies are being connected to each other by "through-silicon-vias" (TSVs). Generally, a semiconductor die is mounted to a base substrate, and then bonding pads of the dies are connected to the base substrate through conductive vias (e.g., TSVs) that extend through the base substrate to make electrical connections between the bonding pads and circuitry on the base substrate. Some vias have a cylindrical shape, while others have a trapezoidal or any other shape with a thickness that is greater than the height of the structures that are located above the vias. With the increased height of the via, the aspect ratio of the vias (the height of the via divided by the width of the via) can be significant. Furthermore, an interconnect structure (e.g., a redistribution circuit) is typically formed over (e.g., and in some cases on top of) the dies of an MCM. A top portion of the interconnect structure may be formed over a die to electrically connect the die to the base substrate, while the lower portion of the interconnect structure may be formed over the vias that connect the bonding pads of the die to the base substrate. Unfortunately, the high aspect ratio of some vias may cause undesirable effects. For example, if a via is misaligned (e.g., offset to a greater degree than desired) with respect to a bonding pad, the bonding pad may fall down to the lower portion of the interconnect structure. Consequently, the interconnect structure may cover the bonding pad and prevent the bonding pad from making an electrical connection to the base substrate (e.g.
